UNIVERSITY OF DELAWARE
NEWARK DE 19716

Contents

1	Introduction	1
2	Experimental facility	3
2.1	Experimental setup	3
2.2	Coordinate system	5
2.3	Data collection	5
2.4	Current profiles	7
3	Monochromatic wave tests	8
3.1	Breaking wave tests	13
3.2	Wave reflection tests	14
4	Random wave tests	22
5	Narrow banded wave spectra	30
5.1	Wave group tests	30
5.2	Wave packet tests	30
A	Naming convention used for the data files	41
B	Gage positions for the different experiments	43
C	Frequency spectra plots of the current	45
D	Frequency spectra plots for monochromatic breaking wave tests	72
E	Frequency spectra plots for monochromatic wave reflection tests	109
F	Frequency spectra plots for random wave tests	155
G	Wave height distribution plots for random wave tests	216
H	Joint wave height and period distribution plots for random wave tests	277
I	Frequency spectra plots for wave group tests	338

J	Time series for wave group tests	375
K	Time series for wave packet tests	448
L	Frequency spectra plots for wave packet tests	521

List of Tables

1	Parameters for monochromatic breaking wave tests determined at $x = -5.2$ m	16
2	Parameters for monochromatic wave reflection tests determined at $x = -4.6$ m	17
3	Spectral parameters for random wave tests determined at $x = -4.6$ m	23
4	Parameters for wave group tests determined at $x = -4.6$ m	31
5	Parameters for wave packet tests determined at $x = -4.6$ m	35
6	Profile Particulars of the ADV measurements	42
7	Vertical measurement positions for each velocity profile	42
8	Gage positions for monochromatic breaking wave tests	43
9	Gage positions for monochromatic wave reflection tests	43
10	Gage positions for random wave, wave groups and wave packet tests	44

List of Figures

1	Wave Blocking at Indian River Inlet, DE USA	2
2	Wave field close to the blocking point	2
3	Schematic plan view of the experimental setup	4
4	Mean velocity profiles at $x = -4.2$ m; 'o' $y/b = 0.25$, 'x' $y/b = 0.5$, 'o' $y/b = 0.75$	8
5	Mean velocity profiles at $x = -2.7$ m; 'o' $y/b = 0.25$, 'x' $y/b = 0.5$, 'o' $y/b = 0.75$	9
6	Mean velocity profiles at $x = -1.2$ m; 'o' $y/b = 0.28$, 'x' $y/b = 0.5$, 'o' $y/b = 0.72$	9
7	Mean velocity profiles at $x = -0.2$ m; 'o' $y/b = 0.34$, 'x' $y/b = 0.66$	10
8	Mean velocity profiles at $x = 0.8$ m; 'o' $y/b = 0.36$, 'x' $y/b = 0.64$	10

9	Turbulence profiles at $x = -4.2\text{m}$; \circ $y/b = 0.25$, \times $y/b = 0.5$, \diamond $y/b = 0.75$	11
10	Turbulence profiles at $x = -2.7\text{m}$; \circ $y/b = 0.25$, \times $y/b = 0.5$, \diamond $y/b = 0.75$	11
11	Turbulence profiles at $x = -1.2\text{m}$; \circ $y/b = 0.28$, \times $y/b = 0.5$, \diamond $y/b = 0.72$	12
12	Turbulence profiles at $x = -0.2\text{m}$; \circ $y/b = 0.34$, \times $y/b = 0.66$	12
13	Turbulence profiles at $x = 0.8\text{m}$; \circ $y/b = 0.36$, \times $y/b = 0.64$.	13
14	Repeatability for monochromatic breaking wave tests	16
15	Repeatability for monochromatic wave reflection tests	17
16	Wave height distribution for monochromatic breaking wave tests	18
17	Wave period distribution for monochromatic breaking wave tests	19
18	Wave height distribution for monochromatic wave reflection tests	20
19	Wave period distribution for monochromatic wave reflection tests	21
20	Repeatability for random wave tests	23
21	Incident frequency spectra for random wave tests 1 – 12, measured at $x = -4.6$ m	24
22	Incident frequency spectra for random wave tests 13 – 20, measured at $x = -4.6$ m	25
23	Significant wave height distribution for random wave tests 1 – 12	26
24	Significant wave height distribution for random wave tests 13 – 20	27
25	Significant wave period distribution for random wave tests 1 – 12	28
26	Significant wave period distribution for random wave tests 13 – 20	29
27	Repeatability for wave group tests	31
28	Frequency spectra at $x = -4.6$ m for wave group tests	32
29	Time series at $x = -4.6$ m for Tests 1 – 6 (wave group tests) .	33
30	Time series at $x = -4.6$ m for Tests 7 – 12 (wave group tests)	34
31	Time series of the wave paddle motion for Tests 1 – 6 (wave packet tests)	36
32	Time series of the wave paddle motion for Tests 7 – 12 (wave packet tests)	37
33	Time series of the water surface at $x = -4.6$ m for Tests 1 – 6 (wave packet tests)	38
34	Time series of the water surface at $x = -4.6$ m for Tests 7 – 12 (wave packet tests)	39

35	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.25 (current only)	46
36	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.5 (current only)	47
37	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.75 (current only)	48
38	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.25 (waves + current)	49
39	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.5 (waves + current)	50
40	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.75 (waves + current)	51
41	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.25 (current only)	52
42	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.5 (current only)	53
43	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.75 (current only)	54
44	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.25 (waves + current)	55
45	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.5 (waves + current)	56
46	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.75 (waves + current)	57
47	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.28 (current only)	58
48	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.5 (current only)	59
49	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.72 (current only)	60
50	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.28 (waves + current)	61
51	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.5 (waves + current)	62
52	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.72 (waves + current)	63
53	Current spectra as a function of depth at $x = -0.2$ m $y/b =$ 0.34 (current only)	64

35	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.25 (current only)	46
36	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.5 (current only)	47
37	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.75 (current only)	48
38	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.25 (waves + current)	49
39	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.5 (waves + current)	50
40	Current spectra as a function of depth at $x = -4.2$ m $y/b =$ 0.75 (waves + current)	51
41	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.25 (current only)	52
42	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.5 (current only)	53
43	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.75 (current only)	54
44	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.25 (waves + current)	55
45	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.5 (waves + current)	56
46	Current spectra as a function of depth at $x = -2.7$ m $y/b =$ 0.75 (waves + current)	57
47	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.28 (current only)	58
48	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.5 (current only)	59
49	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.72 (current only)	60
50	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.28 (waves + current)	61
51	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.5 (waves + current)	62
52	Current spectra as a function of depth at $x = -1.2$ m $y/b =$ 0.72 (waves + current)	63
53	Current spectra as a function of depth at $x = -0.2$ m $y/b =$ 0.34 (current only)	64

54	Current spectra as a function of depth at $x = -0.2$ m $y/b = 0.66$ (current only)	65
55	Current spectra as a function of depth at $x = -0.2$ m $y/b = 0.34$ (current only)	66
56	Current spectra as a function of depth at $x = -0.2$ m $y/b = 0.66$ (waves + current)	67
57	Current spectra as a function of depth at $x = 0.8$ m $y/b = 0.36$ (current only)	68
58	Current spectra as a function of depth at $x = 0.8$ m $y/b = 0.64$ (current only)	69
59	Current spectra as a function of depth at $x = 0.8$ m $y/b = 0.36$ (waves + current)	70
60	Current spectra as a function of depth at $x = 0.8$ m $y/b = 0.64$ (waves + current)	71
61	Wave energy spectra at gages 1–15 for Test 1 (monochromatic breaking wave tests)	73
62	Wave energy spectra at gages 16 – 29 for Test 1 (monochromatic breaking wave tests)	74
63	Wave energy spectra at gages 1–15 for Test 2 (monochromatic breaking wave tests)	75
64	Wave energy spectra at gages 16 – 29 for Test 2 (monochromatic breaking wave tests)	76
65	Wave energy spectra at gages 1–15 for Test 3 (monochromatic breaking wave tests)	77
66	Wave energy spectra at gages 16 – 29 for Test 3 (monochromatic breaking wave tests)	78
67	Wave energy spectra at gages 1–15 for Test 4 (monochromatic breaking wave tests)	79
68	Wave energy spectra at gages 16 – 29 for Test 4 (monochromatic breaking wave tests)	80
69	Wave energy spectra at gages 1–15 for Test 5 (monochromatic breaking wave tests)	81
70	Wave energy spectra at gages 16 – 29 for Test 5 (monochromatic breaking wave tests)	82
71	Wave energy spectra at gages 1–15 for Test 6 (monochromatic breaking wave tests)	83
72	Wave energy spectra at gages 16 – 29 for Test 6 (monochromatic breaking wave tests)	84

73	Wave energy spectra at gages 1–15 for Test 7 (monochromatic breaking wave tests)	85
74	Wave energy spectra at gages 16 – 29 for Test 7 (monochromatic breaking wave tests)	86
75	Wave energy spectra at gages 1–15 for Test 8 (monochromatic breaking wave tests)	87
76	Wave energy spectra at gages 16 – 29 for Test 8 (monochromatic breaking wave tests)	88
77	Wave energy spectra at gages 1–15 for Test 9 (monochromatic breaking wave tests)	89
78	Wave energy spectra at gages 16 – 29 for Test 9 (monochromatic breaking wave tests)	90
79	Wave energy spectra at gages 1 – 15 for Test 10 (monochromatic breaking wave tests)	91
80	Wave energy spectra at gages 16 – 29 for Test 10 (monochromatic breaking wave tests)	92
81	Wave energy spectra at gages 1 – 15 for Test 11 (monochromatic breaking wave tests)	93
82	Wave energy spectra at gages 16 – 29 for Test 11 (monochromatic breaking wave tests)	94
83	Wave energy spectra at gages 1 – 15 for Test 12 (monochromatic breaking wave tests)	95
84	Wave energy spectra at gages 16 – 29 for Test 12 (monochromatic breaking wave tests)	96
85	Wave energy spectra at gages 1 – 15 for Test 13 (monochromatic breaking wave tests)	97
86	Wave energy spectra at gages 16 – 29 for Test 13 (monochromatic breaking wave tests)	98
87	Wave energy spectra at gages 1 – 15 for Test 14 (monochromatic breaking wave tests)	99
88	Wave energy spectra at gages 16 – 29 for Test 14 (monochromatic breaking wave tests)	100
89	Wave energy spectra at gages 1 – 15 for Test 15 (monochromatic breaking wave tests)	101
90	Wave energy spectra at gages 16 – 29 for Test 15 (monochromatic breaking wave tests)	102
91	Wave energy spectra at gages 1 – 15 for Test 16 (monochromatic breaking wave tests)	103

92	Wave energy spectra at gages 16 – 29 for Test 16 (monochromatic breaking wave tests)	104
93	Wave energy spectra at gages 1 – 15 for Test 17 (monochromatic breaking wave tests)	105
94	Wave energy spectra at gages 16 – 29 for Test 17 (monochromatic breaking wave tests)	106
95	Wave energy spectra at gages 1 – 15 for Test 18 (monochromatic breaking wave tests)	107
96	Wave energy spectra at gages 16 – 29 for Test 18 (monochromatic breaking wave tests)	108
97	Wave energy spectra at gages 1–15 for Test 1 (monochromatic wave reflection tests)	110
98	Wave energy spectra at gages 16 – 29 for Test 1 (monochromatic wave reflection tests)	111
99	Wave energy spectra at gages 30 – 43 for Test 1 (monochromatic wave reflection tests)	112
100	Wave energy spectra at gages 1–15 for Test 2 (monochromatic wave reflection tests)	113
101	Wave energy spectra at gages 16 – 29 for Test 2 (monochromatic wave reflection tests)	114
102	Wave energy spectra at gages 30 – 43 for Test 2 (monochromatic wave reflection tests)	115
103	Wave energy spectra at gages 1–15 for Test 3 (monochromatic wave reflection tests)	116
104	Wave energy spectra at gages 16 – 29 for Test 3 (monochromatic wave reflection tests)	117
105	Wave energy spectra at gages 30 – 43 for Test 3 (monochromatic wave reflection tests)	118
106	Wave energy spectra at gages 1–15 for Test 4 (monochromatic wave reflection tests)	119
107	Wave energy spectra at gages 16 – 29 for Test 4 (monochromatic wave reflection tests)	120
108	Wave energy spectra at gages 30 – 43 for Test 4 (monochromatic wave reflection tests)	121
109	Wave energy spectra at gages 1–15 for Test 5 (monochromatic wave reflection tests)	122
110	Wave energy spectra at gages 16 – 29 for Test 5 (monochromatic wave reflection tests)	123

111	Wave energy spectra at gages 30 – 43 for Test 5 (monochromatic wave reflection tests)	124
112	Wave energy spectra at gages 1–15 for Test 6 (monochromatic wave reflection tests)	125
113	Wave energy spectra at gages 16 – 29 for Test 6 (monochromatic wave reflection tests)	126
114	Wave energy spectra at gages 30 – 43 for Test 6 (monochromatic wave reflection tests)	127
115	Wave energy spectra at gages 1–15 for Test 7 (monochromatic wave reflection tests)	128
116	Wave energy spectra at gages 16 – 29 for Test 7 (monochromatic wave reflection tests)	129
117	Wave energy spectra at gages 30 – 43 for Test 7 (monochromatic wave reflection tests)	130
118	Wave energy spectra at gages 1–15 for Test 8 (monochromatic wave reflection tests)	131
119	Wave energy spectra at gages 16 – 29 for Test 8 (monochromatic wave reflection tests)	132
120	Wave energy spectra at gages 30 – 43 for Test 8 (monochromatic wave reflection tests)	133
121	Wave energy spectra at gages 1–15 for Test 9 (monochromatic wave reflection tests)	134
122	Wave energy spectra at gages 16 – 29 for Test 9 (monochromatic wave reflection tests)	135
123	Wave energy spectra at gages 30 – 43 for Test 9 (monochromatic wave reflection tests)	136
124	Wave energy spectra at gages 1 – 15 for Test 10 (monochromatic wave reflection tests)	137
125	Wave energy spectra at gages 16 – 29 for Test 10 (monochromatic wave reflection tests)	138
126	Wave energy spectra at gages 30 – 43 for Test 10 (monochromatic wave reflection tests)	139
127	Wave energy spectra at gages 1 – 15 for Test 11 (monochromatic wave reflection tests)	140
128	Wave energy spectra at gages 16 – 29 for Test 11 (monochromatic wave reflection tests)	141
129	Wave energy spectra at gages 30 – 43 for Test 11 (monochromatic wave reflection tests)	142

130	Wave energy spectra at gages 1 – 15 for Test 12 (monochromatic wave reflection tests)	143
131	Wave energy spectra at gages 16 – 29 for Test 12 (monochromatic wave reflection tests)	144
132	Wave energy spectra at gages 30 – 43 for Test 12 (monochromatic wave reflection tests)	145
133	Wave energy spectra at gages 1 – 15 for Test 13 (monochromatic wave reflection tests)	146
134	Wave energy spectra at gages 16 – 29 for Test 13 (monochromatic wave reflection tests)	147
135	Wave energy spectra at gages 30 – 43 for Test 13 (monochromatic wave reflection tests)	148
136	Wave energy spectra at gages 1 – 15 for Test 14 (monochromatic wave reflection tests)	149
137	Wave energy spectra at gages 16 – 29 for Test 14 (monochromatic wave reflection tests)	150
138	Wave energy spectra at gages 30 – 43 for Test 14 (monochromatic wave reflection tests)	151
139	Wave energy spectra at gages 1 – 15 for Test 15 (monochromatic wave reflection tests)	152
140	Wave energy spectra at gages 16 – 29 for Test 15 (monochromatic wave reflection tests)	153
141	Wave energy spectra at gages 30 – 43 for Test 15 (monochromatic wave reflection tests)	154
142	Wave energy spectra at gages 1 – 12 for Test 1 (random wave tests)	156
143	Wave energy spectra at gages 13 – 24 for Test 1 (random wave tests)	157
144	Wave energy spectra at gages 25 – 36 for Test 1 (random wave tests)	158
145	Wave energy spectra at gages 1 – 12 for Test 2 (random wave tests)	159
146	Wave energy spectra at gages 13 – 24 for Test 2 (random wave tests)	160
147	Wave energy spectra at gages 25 – 36 for Test 2 (random wave tests)	161
148	Wave energy spectra at gages 1 – 12 for Test 3 (random wave tests)	162

149	Wave energy spectra at gages 13 – 24 for Test 3 (random wave tests)	163
150	Wave energy spectra at gages 25 – 36 for Test 3 (random wave tests)	164
151	Wave energy spectra at gages 1 – 12 for Test 4 (random wave tests)	165
152	Wave energy spectra at gages 13 – 24 for Test 4 (random wave tests)	166
153	Wave energy spectra at gages 25 – 36 for Test 4 (random wave tests)	167
154	Wave energy spectra at gages 1 – 12 for Test 5 (random wave tests)	168
155	Wave energy spectra at gages 13 – 24 for Test 5 (random wave tests)	169
156	Wave energy spectra at gages 25 – 36 for Test 5 (random wave tests)	170
157	Wave energy spectra at gages 1 – 12 for Test 6 (random wave tests)	171
158	Wave energy spectra at gages 13 – 24 for Test 6 (random wave tests)	172
159	Wave energy spectra at gages 25 – 36 for Test 6 (random wave tests)	173
160	Wave energy spectra at gages 1 – 12 for Test 7 (random wave tests)	174
161	Wave energy spectra at gages 13 – 24 for Test 7 (random wave tests)	175
162	Wave energy spectra at gages 25 – 36 for Test 7 (random wave tests)	176
163	Wave energy spectra at gages 1 – 12 for Test 8 (random wave tests)	177
164	Wave energy spectra at gages 13 – 24 for Test 8 (random wave tests)	178
165	Wave energy spectra at gages 25 – 36 for Test 8 (random wave tests)	179
166	Wave energy spectra at gages 1 – 12 for Test 9 (random wave tests)	180
167	Wave energy spectra at gages 13 – 24 for Test 9 (random wave tests)	181

168	Wave energy spectra at gages 25 – 36 for Test 9 (random wave tests)	182
169	Wave energy spectra at gages 1 – 12 for Test 10 (random wave tests)	183
170	Wave energy spectra at gages 13 – 24 for Test 10 (random wave tests)	184
171	Wave energy spectra at gages 25 – 36 for Test 10 (random wave tests)	185
172	Wave energy spectra at gages 1 – 12 for Test 11 (random wave tests)	186
173	Wave energy spectra at gages 13 – 24 for Test 11 (random wave tests)	187
174	Wave energy spectra at gages 25 – 36 for Test 11 (random wave tests)	188
175	Wave energy spectra at gages 1 – 12 for Test 12 (random wave tests)	189
176	Wave energy spectra at gages 13 – 24 for Test 12 (random wave tests)	190
177	Wave energy spectra at gages 25 – 36 for Test 12 (random wave tests)	191
178	Wave energy spectra at gages 1 – 12 for Test 13 (random wave tests)	192
179	Wave energy spectra at gages 13 – 24 for Test 13 (random wave tests)	193
180	Wave energy spectra at gages 25 – 36 for Test 13 (random wave tests)	194
181	Wave energy spectra at gages 1 – 12 for Test 14 (random wave tests)	195
182	Wave energy spectra at gages 13 – 24 for Test 14 (random wave tests)	196
183	Wave energy spectra at gages 25 – 36 for Test 14 (random wave tests)	197
184	Wave energy spectra at gages 1 – 12 for Test 15 (random wave tests)	198
185	Wave energy spectra at gages 13 – 24 for Test 15 (random wave tests)	199
186	Wave energy spectra at gages 25 – 36 for Test 15 (random wave tests)	200

187	Wave energy spectra at gages 1 – 12 for Test 16 (random wave tests)	201
188	Wave energy spectra at gages 13 – 24 for Test 16 (random wave tests)	202
189	Wave energy spectra at gages 25 – 36 for Test 16 (random wave tests)	203
190	Wave energy spectra at gages 1 – 12 for Test 17 (random wave tests)	204
191	Wave energy spectra at gages 13 – 24 for Test 17 (random wave tests)	205
192	Wave energy spectra at gages 25 – 36 for Test 17 (random wave tests)	206
193	Wave energy spectra at gages 1 – 12 for Test 18 (random wave tests)	207
194	Wave energy spectra at gages 13 – 24 for Test 18 (random wave tests)	208
195	Wave energy spectra at gages 25 – 36 for Test 18 (random wave tests)	209
196	Wave energy spectra at gages 1 – 12 for Test 19 (random wave tests)	210
197	Wave energy spectra at gages 13 – 24 for Test 19 (random wave tests)	211
198	Wave energy spectra at gages 25 – 36 for Test 19 (random wave tests)	212
199	Wave energy spectra at gages 1 – 12 for Test 20 (random wave tests)	213
200	Wave energy spectra at gages 13 – 24 for Test 20 (random wave tests)	214
201	Wave energy spectra at gages 25 – 36 for Test 20 (random wave tests)	215
202	Wave height distribution at gages 1 – 12 for Test 1, 'solid line' Rayleigh distribution (random wave tests)	217
203	Wave height distribution at gages 13 – 24 for Test 1, 'solid line' Rayleigh distribution (random wave tests)	218
204	Wave height distribution at gages 25 – 36 for Test 1, 'solid line' Rayleigh distribution (random wave tests)	219
205	Wave height distribution at gages 1 – 12 for Test 2, 'solid line' Rayleigh distribution (random wave tests)	220

206	Wave height distribution at gages 13 – 24 for Test 2, 'solid line' Rayleigh distribution (random wave tests)	221
207	Wave height distribution at gages 25 – 36 for Test 2, 'solid line' Rayleigh distribution (random wave tests)	222
208	Wave height distribution at gages 1 – 12 for Test 3, 'solid line' Rayleigh distribution (random wave tests)	223
209	Wave height distribution at gages 13 – 24 for Test 3, 'solid line' Rayleigh distribution (random wave tests)	224
210	Wave height distribution at gages 25 – 36 for Test 3, 'solid line' Rayleigh distribution (random wave tests)	225
211	Wave height distribution at gages 1 – 12 for Test 4, 'solid line' Rayleigh distribution (random wave tests)	226
212	Wave height distribution at gages 13 – 24 for Test 4, 'solid line' Rayleigh distribution (random wave tests)	227
213	Wave height distribution at gages 25 – 36 for Test 4, 'solid line' Rayleigh distribution (random wave tests)	228
214	Wave height distribution at gages 1 – 12 for Test 5, 'solid line' Rayleigh distribution (random wave tests)	229
215	Wave height distribution at gages 13 – 24 for Test 5, 'solid line' Rayleigh distribution (random wave tests)	230
216	Wave height distribution at gages 25 – 36 for Test 5, 'solid line' Rayleigh distribution (random wave tests)	231
217	Wave height distribution at gages 1 – 12 for Test 6, 'solid line' Rayleigh distribution (random wave tests)	232
218	Wave height distribution at gages 13 – 24 for Test 6, 'solid line' Rayleigh distribution (random wave tests)	233
219	Wave height distribution at gages 25 – 36 for Test 6, 'solid line' Rayleigh distribution (random wave tests)	234
220	Wave height distribution at gages 1 – 12 for Test 7, 'solid line' Rayleigh distribution (random wave tests)	235
221	Wave height distribution at gages 13 – 24 for Test 7, 'solid line' Rayleigh distribution (random wave tests)	236
222	Wave height distribution at gages 25 – 36 for Test 7, 'solid line' Rayleigh distribution (random wave tests)	237
223	Wave height distribution at gages 1 – 12 for Test 8, 'solid line' Rayleigh distribution (random wave tests)	238
224	Wave height distribution at gages 13 – 24 for Test 8, 'solid line' Rayleigh distribution (random wave tests)	239

225	Wave height distribution at gages 25 – 36 for Test 8, 'solid line' Rayleigh distribution (random wave tests)	240
226	Wave height distribution at gages 1 – 12 for Test 9, 'solid line' Rayleigh distribution (random wave tests)	241
227	Wave height distribution at gages 13 – 24 for Test 9, 'solid line' Rayleigh distribution (random wave tests)	242
228	Wave height distribution at gages 25 – 36 for Test 9, 'solid line' Rayleigh distribution (random wave tests)	243
229	Wave height distribution at gages 1 – 12 for Test 10, 'solid line' Rayleigh distribution (random wave tests)	244
230	Wave height distribution at gages 13 – 24 for Test 10, 'solid line' Rayleigh distribution (random wave tests)	245
231	Wave height distribution at gages 25 – 36 for Test 10, 'solid line' Rayleigh distribution (random wave tests)	246
232	Wave height distribution at gages 1 – 12 for Test 11, 'solid line' Rayleigh distribution (random wave tests)	247
233	Wave height distribution at gages 13 – 24 for Test 11, 'solid line' Rayleigh distribution (random wave tests)	248
234	Wave height distribution at gages 25 – 36 for Test 11, 'solid line' Rayleigh distribution (random wave tests)	249
235	Wave height distribution at gages 1 – 12 for Test 12, 'solid line' Rayleigh distribution (random wave tests)	250
236	Wave height distribution at gages 13 – 24 for Test 12, 'solid line' Rayleigh distribution (random wave tests)	251
237	Wave height distribution at gages 25 – 36 for Test 12, 'solid line' Rayleigh distribution (random wave tests)	252
238	Wave height distribution at gages 1 – 12 for Test 13, 'solid line' Rayleigh distribution (random wave tests)	253
239	Wave height distribution at gages 13 – 24 for Test 13, 'solid line' Rayleigh distribution (random wave tests)	254
240	Wave height distribution at gages 25 – 36 for Test 13, 'solid line' Rayleigh distribution (random wave tests)	255
241	Wave height distribution at gages 1 – 12 for Test 14, 'solid line' Rayleigh distribution (random wave tests)	256
242	Wave height distribution at gages 13 – 24 for Test 14, 'solid line' Rayleigh distribution (random wave tests)	257
243	Wave height distribution at gages 25 – 36 for Test 14, 'solid line' Rayleigh distribution (random wave tests)	258

244	Wave height distribution at gages 1 – 12 for Test 15, 'solid line' Rayleigh distribution (random wave tests)	259
245	Wave height distribution at gages 13 – 24 for Test 15, 'solid line' Rayleigh distribution (random wave tests)	260
246	Wave height distribution at gages 25 – 36 for Test 15, 'solid line' Rayleigh distribution (random wave tests)	261
247	Wave height distribution at gages 1 – 12 for Test 16, 'solid line' Rayleigh distribution (random wave tests)	262
248	Wave height distribution at gages 13 – 24 for Test 16, 'solid line' Rayleigh distribution (random wave tests)	263
249	Wave height distribution at gages 25 – 36 for Test 16, 'solid line' Rayleigh distribution (random wave tests)	264
250	Wave height distribution at gages 1 – 12 for Test 17, 'solid line' Rayleigh distribution (random wave tests)	265
251	Wave height distribution at gages 13 – 24 for Test 17, 'solid line' Rayleigh distribution (random wave tests)	266
252	Wave height distribution at gages 25 – 36 for Test 17, 'solid line' Rayleigh distribution (random wave tests)	267
253	Wave height distribution at gages 1 – 12 for Test 18, 'solid line' Rayleigh distribution (random wave tests)	268
254	Wave height distribution at gages 13 – 24 for Test 18, 'solid line' Rayleigh distribution (random wave tests)	269
255	Wave height distribution at gages 25 – 36 for Test 18, 'solid line' Rayleigh distribution (random wave tests)	270
256	Wave height distribution at gages 1 – 12 for Test 19, 'solid line' Rayleigh distribution (random wave tests)	271
257	Wave height distribution at gages 13 – 24 for Test 19, 'solid line' Rayleigh distribution (random wave tests)	272
258	Wave height distribution at gages 25 – 36 for Test 19, 'solid line' Rayleigh distribution (random wave tests)	273
259	Wave height distribution at gages 1 – 12 for Test 20, 'solid line' Rayleigh distribution (random wave tests)	274
260	Wave height distribution at gages 13 – 24 for Test 20, 'solid line' Rayleigh distribution (random wave tests)	275
261	Wave height distribution at gages 25 – 36 for Test 20, 'solid line' Rayleigh distribution (random wave tests)	276
262	Joint wave height and period distribution at gages 1 – 12 for Test 1, (random wave tests)	278

263	Joint wave height and period distribution at gages 13 – 24 for Test 1, (random wave tests)	279
264	Joint wave height and period distribution at gages 25 – 36 for Test 1, (random wave tests)	280
265	Joint wave height and period distribution at gages 1 – 12 for Test 2, (random wave tests)	281
266	Joint wave height and period distribution at gages 13 – 24 for Test 2, (random wave tests)	282
267	Joint wave height and period distribution at gages 25 – 36 for Test 2, (random wave tests)	283
268	Joint wave height and period distribution at gages 1 – 12 for Test 3, (random wave tests)	284
269	Joint wave height and period distribution at gages 13 – 24 for Test 3, (random wave tests)	285
270	Joint wave height and period distribution at gages 25 – 36 for Test 3, (random wave tests)	286
271	Joint wave height and period distribution at gages 1 – 12 for Test 4, (random wave tests)	287
272	Joint wave height and period distribution at gages 13 – 24 for Test 4, (random wave tests)	288
273	Joint wave height and period distribution at gages 25 – 36 for Test 4, (random wave tests)	289
274	Joint wave height and period distribution at gages 1 – 12 for Test 5, (random wave tests)	290
275	Joint wave height and period distribution at gages 13 – 24 for Test 5, (random wave tests)	291
276	Joint wave height and period distribution at gages 25 – 36 for Test 5, (random wave tests)	292
277	Joint wave height and period distribution at gages 1 – 12 for Test 6, (random wave tests)	293
278	Joint wave height and period distribution at gages 13 – 24 for Test 6, (random wave tests)	294
279	Joint wave height and period distribution at gages 25 – 36 for Test 6, (random wave tests)	295
280	Joint wave height and period distribution at gages 1 – 12 for Test 7, (random wave tests)	296
281	Joint wave height and period distribution at gages 13 – 24 for Test 7, (random wave tests)	297

282	Joint wave height and period distribution at gages 25 – 36 for Test 7, (random wave tests)	298
283	Joint wave height and period distribution at gages 1 – 12 for Test 8, (random wave tests)	299
284	Joint wave height and period distribution at gages 13 – 24 for Test 8, (random wave tests)	300
285	Joint wave height and period distribution at gages 25 – 36 for Test 8, (random wave tests)	301
286	Joint wave height and period distribution at gages 1 – 12 for Test 9, (random wave tests)	302
287	Joint wave height and period distribution at gages 13 – 24 for Test 9, (random wave tests)	303
288	Joint wave height and period distribution at gages 25 – 36 for Test 9, (random wave tests)	304
289	Joint wave height and period distribution at gages 1 – 12 for Test 10, (random wave tests)	305
290	Joint wave height and period distribution at gages 13 – 24 for Test 10, (random wave tests)	306
291	Joint wave height and period distribution at gages 25 – 36 for Test 10, (random wave tests)	307
292	Joint wave height and period distribution at gages 1 – 12 for Test 11, (random wave tests)	308
293	Joint wave height and period distribution at gages 13 – 24 for Test 11, (random wave tests)	309
294	Joint wave height and period distribution at gages 25 – 36 for Test 11, (random wave tests)	310
295	Joint wave height and period distribution at gages 1 – 12 for Test 12, (random wave tests)	311
296	Joint wave height and period distribution at gages 13 – 24 for Test 12, (random wave tests)	312
297	Joint wave height and period distribution at gages 25 – 36 for Test 12, (random wave tests)	313
298	Joint wave height and period distribution at gages 1 – 12 for Test 13, (random wave tests)	314
299	Joint wave height and period distribution at gages 13 – 24 for Test 13, (random wave tests)	315
300	Joint wave height and period distribution at gages 25 – 36 for Test 13, (random wave tests)	316

301	Joint wave height and period distribution at gages 1 – 12 for Test 14, (random wave tests)	317
302	Joint wave height and period distribution at gages 13 – 24 for Test 14, (random wave tests)	318
303	Joint wave height and period distribution at gages 25 – 36 for Test 14, (random wave tests)	319
304	Joint wave height and period distribution at gages 1 – 12 for Test 15, (random wave tests)	320
305	Joint wave height and period distribution at gages 13 – 24 for Test 15, (random wave tests)	321
306	Joint wave height and period distribution at gages 25 – 36 for Test 15, (random wave tests)	322
307	Joint wave height and period distribution at gages 1 – 12 for Test 16, (random wave tests)	323
308	Joint wave height and period distribution at gages 13 – 24 for Test 16, (random wave tests)	324
309	Joint wave height and period distribution at gages 25 – 36 for Test 16, (random wave tests)	325
310	Joint wave height and period distribution at gages 1 – 12 for Test 17, (random wave tests)	326
311	Joint wave height and period distribution at gages 13 – 24 for Test 17, (random wave tests)	327
312	Joint wave height and period distribution at gages 25 – 36 for Test 17, (random wave tests)	328
313	Joint wave height and period distribution at gages 1 – 12 for Test 18, (random wave tests)	329
314	Joint wave height and period distribution at gages 13 – 24 for Test 18, (random wave tests)	330
315	Joint wave height and period distribution at gages 25 – 36 for Test 18, (random wave tests)	331
316	Joint wave height and period distribution at gages 1 – 12 for Test 19, (random wave tests)	332
317	Joint wave height and period distribution at gages 13 – 24 for Test 19, (random wave tests)	333
318	Joint wave height and period distribution at gages 25 – 36 for Test 19, (random wave tests)	334
319	Joint wave height and period distribution at gages 1 – 12 for Test 20, (random wave tests)	335

320	Joint wave height and period distribution at gages 13 – 24 for Test 20, (random wave tests)	336
321	Joint wave height and period distribution at gages 25 – 36 for Test 20, (random wave tests)	337
322	Wave energy spectra at gages 1 – 12 for Test 1 (wave group tests)	339
323	Wave energy spectra at gages 13 – 24 for Test 1 (wave group tests)	340
324	Wave energy spectra at gages 25 – 36 for Test 1 (wave group tests)	341
325	Wave energy spectra at gages 1 – 12 for Test 2 (wave group tests)	342
326	Wave energy spectra at gages 13 – 24 for Test 2 (wave group tests)	343
327	Wave energy spectra at gages 25 – 36 for Test 2 (wave group tests)	344
328	Wave energy spectra at gages 1 – 12 for Test 3 (wave group tests)	345
329	Wave energy spectra at gages 13 – 24 for Test 3 (wave group tests)	346
330	Wave energy spectra at gages 25 – 36 for Test 3 (wave group tests)	347
331	Wave energy spectra at gages 1 – 12 for Test 4 (wave group tests)	348
332	Wave energy spectra at gages 13 – 24 for Test 4 (wave group tests)	349
333	Wave energy spectra at gages 25 – 36 for Test 4 (wave group tests)	350
334	Wave energy spectra at gages 1 – 12 for Test 5 (wave group tests)	351
335	Wave energy spectra at gages 13 – 24 for Test 5 (wave group tests)	352
336	Wave energy spectra at gages 25 – 36 for Test 5 (wave group tests)	353
337	Wave energy spectra at gages 1 – 12 for Test 6 (wave group tests)	354
338	Wave energy spectra at gages 13 – 24 for Test 6 (wave group tests)	355

339	Wave energy spectra at gages 25 – 36 for Test 6 (wave group tests)	356

1 Introduction

Wave blocking is a phenomenon in which the energy of propagating waves is stopped by a strong opposing current. As waves propagate into opposing currents, their group velocity reduces leading to the waves shoaling on the current. If the current is strong enough then this group velocity could go to zero causing the waves to get blocked. This is fairly common at the entrances of river inlets where tidal currents can become very strong. One such example of wave blocking is shown in Figure 1. The photograph has been taken three hours after high tide, and thus, there is a strong current propagating out of the inlet. This strong current blocks waves that are trying to propagate into the inlet. Due to the sharp increase in wave steepness prior to blocking, the wave environment tends to become very rough, as can be seen in Figure 2. This causes considerable navigational hazards and boats have been known to capsizе trying to cross the inlets under such circumstances.

There are many references in the literature on the dynamics of strong wave-current interactions. Bretherton and Garrett (1969) have shown that in the presence of a current it is the wave action that is conserved and not the wave energy. However, this conservation principle is based on ray theory approximations and fails close to the blocking point which is a caustic. Smith (1975) obtained a uniform solution for the wave amplitude through the blocking region. He showed that around the blocking region the amplitude envelope is given by an Airy function, and away from the blocking region the wave field consists of an incident wave and a much shorter reflected wave. Peregrine (1976) obtained the same results with the help of stream functions. Lately Shyu and Phillips (1990) and Trulsen and Mei (1993) have extended the results to include the effects of surface tension which, if the reflected waves are short enough, leads to the waves being reflected again from a second reflection point.

All these theories are based on the linear wave assumption and require that the incident waves be very small. In inlets these conditions are rarely satisfied and most waves break at or before the blocking point without getting reflected. Even those waves which do not get blocked lose a considerable amount of energy due to waves breaking on the strong currents. As opposed to depth limited wave breaking, there is a scarcity of experimental data to study current limited wave breaking. Lai *et al.* (1989) have studied the kinematics of the strong interaction between waves and opposing currents but do not give any results about the dynamics.

Figure 1: Wave Blocking at Indian River Inlet, DE USA

Figure 2: Wave field close to the blocking point

To develop a better understanding of the dynamics involved in the interactions between waves and strong opposing currents, a series of experiments have been conducted at the Center for Applied Coastal Research. The study is broadly divided into three parts -- monochromatic wave tests, random wave tests using fairly broad TMA spectra, and narrow spectral tests which lead to modulating wave trains. The tests range from conditions where the waves are blocked and reflected to conditions where there is steepness limited wave breaking as the waves shoal on an opposing current.

The purpose of this report is to catalog all the experiments. The report consists of a main part where the experimental setup and the different experiments are described in details. The second part of the report consists of the Appendices which contain the naming convention used for the different experiments, the gage coordinate positions and the figures from all the tests. Due to the voluminous nature of the report only the main section and the two Appendices describing the naming convention and gage coordinates are available in print form. The remaining Appendices containing all the figures may be obtained by request or by anonymous ftp from [coastal.udel.edu](ftp://coastal.udel.edu). The report together with its Appendices is stored in [pub/reports](ftp://pub/reports).

2 Experimental facility

The experiments were conducted in the Center for Applied Coastal Research at the University of Delaware. The aim was to simulate the conditions experienced in inlets during the periods when there are fast tidal currents propagating out of the inlet. Tidal currents are turbulent and, compared to gravity waves, vary over much longer time scales. Thus, in our experiments we generate turbulent currents with a constant mean velocity. Since we wish to isolate the phenomenon of wave blocking, the experiments have been conducted in one dimension only.

2.1 Experimental setup

The experiments were conducted in a 30 m long recirculating flume, and a schematic plan view of the setup is shown in Figure 3. Currents are generated with the help of a pump which draws out water at the rate of $0.09 \text{ m}^3/\text{s}$ from behind the wave paddle and puts it back into the flume at the other end. A flow straightener has been placed in the flume to remove all the large scale

Figure 3: Schematic plan view of the experimental setup

eddies that are generated when the water enters the flume. A perforated “piston-type” wave paddle is used to generate waves in the tank. This allows us to draw out the water from behind the wavemaker, and the vertical profile of the current in front of the wave paddle remains unchanged. The width of the flume is 0.6 m and all the experiments are conducted in a water depth of 0.5 m. The wave periods range from 1.2 – 1.6 s. Thus, the experiments have been conducted in deep to intermediate water depths.

An inlet is constructed by narrowing the width over a section of the flume with the help of a false wall. The width of the narrow channel is 0.36 m. The channel expands slowly to the width of the flume to prevent flow separation in the expansion. Thus, the additional complexity of waves focusing on a laterally growing jet are avoided. The mean current varies from 0.53 m/s inside the inlet to 0.32 m/s away from the inlet. The experiments have been designed such that wave blocking occurs close to the narrow part of the inlet.

An acoustic doppler velocimeter is used to measure the current velocities, while capacitance wave gages are used to measure the time series of the water surface. The surface gage measurements extend from outside the inlet to the end of the narrow part of the inlet and are shown in Figure 3.

2.2 Coordinate system

The origin is placed at the beginning of the narrow part of the inlet with the x - coordinate axis pointing down the length of the flume and positive in the direction of the waves. Thus, the inlet begins at $x = -2.8$ m, and the narrow part of the inlet extends from $x = 0$ till $x = 4.8$ m. Due to symmetry the side wall of the flume becomes the center line of the inlet. The y - coordinate axis points positive towards the false wall with $y = 0$ at the centerline (right wall of the tank). The z - coordinate axis points positive upwards with $z = 0$ at the still water level.

2.3 Data collection

Two different types of instruments have been used for collecting data. The particle velocities have been measured with the help of an acoustic doppler velocimeter (ADV). The velocimeter measures the horizontal velocities only. Since the currents in the experiments are fairly strong there is very little noise and the ADV works very well. The disadvantage with the ADV is that its maximum sampling rate is only 25 hz and thus is not useful for studying the

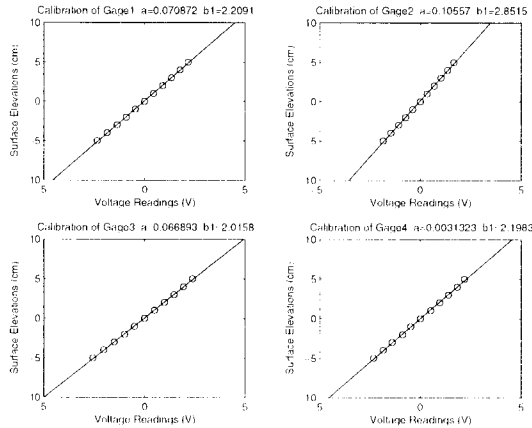

turbulence structure of the current. Nevertheless, it gives very good mean velocity profiles. Data collection for the ADV is done with the help of a PC.

Apart from the ADV, capacitance wave gages have also been used in the experiments. These gages measure the time history of the water surface by giving out a voltage which changes with water level. The gages are calibrated so as to be able to convert the time series from volts to centimeters.

Both the calibration and collection of data from the gages is done with the help of a Concurrent 7200 data acquisition computer system. The computer system contains 80 A/D channels which converts the analog signals from the wave gages into digital signals. A Fortran program called **Take_data** is used to retrieve the information from the channels at a particular sampling rate and store them in individual data files. Unlike the ADV, there is no limit to the rate at which data can be sampled, and the sampling rate typically varied between 50 – 100 hz.

Gage calibration is done by moving the wave gages up and down in still water, and measuring the voltage at 1 cm intervals. To automate the process, stepper motors have been attached to each gage wire. These stepper motors are also controlled by the Concurrent 7200 computer system. Calibration is done with the help of a Fortran program called **Gcal**. To move the stepper motors, **Gcal** uses three A/D clocks. One of the clocks moves the motors through the specified distance between calibration points. The second clock collects the data at each point (100 samples at 100 hz). And the third clock changes the direction of the motors when the total number of calibration points in a particular direction (as specified by the user) have been completed. All the readings are taken with reference to the still water level and a regression analysis carried out. All the gages are sturdy and the calibration curves are linear. A typical calibration curve for 4 gages is shown in Figure 2.3. Changes in water temperatures affect the calibration curves slightly and calibration must be done at least once a day. In our experiments, calibration of the gages was done every time the gages were moved so as to ensure the proper functioning of the gages. Thus, typically calibration of the gages was done 3 to 4 times a day.

The Concurrent 7200 computer system is also used to run the wavemaker. It has 4 D/A boards, and one of the boards is connected to the wavemaker. A Fortran program **Send_data** converts a given paddle time series into an analog signal at the required sampling frequency (specified by the user), which then move the wave paddle. The sampling frequency for moving the wavemaker was around 4000 hz for our experiments, eliminating the need for

analog filtering of the command signal.

2.4 Current profiles

To determine the variation of the current in the flume, a detailed measurement of the current vertical profile was done at various locations in the channel. At each position the horizontal velocity in the x direction has been measured as a time series with the help of the ADV. Data sampling has been done at 25 hz for 330 s. The mean current profiles are shown in Figures 4 - 8, where b refers to the channel width and U refers to the mean velocity defined by

$$U \equiv \langle u(t) \rangle \quad (1)$$

The measurements have been taken for two cases - when there are only currents, and when there is a strong monochromatic breaking wave propagating against the currents. The incident wave corresponds to the Test 6 case for the monochromatic breaking wave tests. There is a considerable amount of wave breaking but the wave does not get blocked by the current. The aim is to check if the mean velocity profile varies across the channel both in the presence and absence of large waves. From the figures we see that there are some variations in the y direction away from the inlet, but inside the inlet this variation is minimal, particularly close to the narrow part of the inlet where all the wave blocking takes place. We make the assumption that variations across the channel are negligible and integrate out the y dependency to simplify our study. Apart from measuring the mean current, the turbulence in the current was also determined. The turbulence has been defined as

Figure 4: Mean velocity profiles at $x = -4.2\text{m}$; \circ $y/b = 0.25$, \times $y/b = 0.5$, \diamond $y/b = 0.75$

$$\tau \equiv \sqrt{\langle (u(t) - U)^2 \rangle} \quad (2)$$

The vertical profiles of turbulence τ/U are given in Figures 9 - 13. There are more cross channel variations in the turbulence profile. Since the velocities due to wave motion have not been separated from the total velocity, the plots show much larger turbulence levels in the presence of waves. The growth of the boundary layer as we move closer to the wavemaker can be clearly observed. The frequency spectra plots of the velocity are given in Appendix C. The spectra have been smoothed via Bartlett averaging. The spectra has 16 degrees of freedom and $\delta f = 0.02 \text{ Hz}$.

3 Monochromatic wave tests

The monochromatic wave tests have been divided into two parts - The breaking wave tests and the wave reflection tests. In both, the test cases consist of a range of wave heights for different wave periods. In the breaking wave tests the wave heights are larger, and most of the waves are breaking with very little wave reflection. In the wave reflection tests the incident wave heights are very small so that waves are reflected from the blocking point without any wave breaking.

3.1 Breaking wave tests

A total of 18 breaking wave test cases were run. The tests have been divided into 3 groups. Each group consists of 6 cases in which the wave period is kept constant and the wave height varied from small to large values. Data has been collected in the form of a time series of the water surface with the help of the capacitance wave gages. A total of 8 capacitance gages were used and data was recorded for 256 wave periods. For each test a detailed data set of 29 gage locations is obtained. This is done by keeping the first gage fixed and moving the remaining 7 gages to 4 different locations and repeating the experiments. The data set from the 4 different runs at the first gage (located at $x = -5.2\text{ m}$) is then used to determine the initial conditions (see Table 1) and also to test the repeatability of the experiments. Figure 14 shows the % deviation in the mean wave heights at the first gage, and shows that the experiments are fairly repeatable to within 6% error.

The wave height and wave period distributions for all the 18 tests are shown in Figures 16 and 17. From Table 1 we can see that Tests 1 to 6 have the same initial wave period with the wave height increasing from Test 1 to Test 6. The same hierarchy exists also for Tests 7 to 12 and Tests 13 to 18, but at different wave periods. The first two group of tests lie in the regime where the waves are blocked in the linear limit by the current. The last group of tests lie just above the linear blocking limit. Except for Tests

1, 7 and 13, where the wave amplitudes are very small, wave breaking due to strong opposing currents was observed in all the test cases. The shoaling of the waves as they propagate into the narrowing channel can be clearly observed, followed by the subsequent decay of wave energy in the narrow part of the channel due to wave breaking and blocking. Fluctuations in the water surface due to the turbulence in the current, are less than 1 cm and make up the noise in the system. Thus, when the wave amplitude falls to the order of these fluctuations, the wave period distribution becomes scattered.

In Tests 1 and 7, where the initial wave amplitude was very small, wave reflection from the blocking point was observed. In Test 13 the wave period is just above the minimum required wave period for wave blocking and we do not expect any waves to be blocked. However the scatter in the data suggests that there might be partial wave blocking (Stiassnie and Dagan, 1979), which disappears for the larger wave heights. The amplitude dispersion effects on the location of the blocking point can be clearly observed in the first group of tests as the wave amplitude increases from Test 1 to Test 6. Similar amplitude effects can also be observed in the Tests 7 to 12. From Figure 17 we find that the wave shifts to a longer period in Tests 5 and 6. This shift is due to the growth of side band instabilities and is the reason why the waves in these two test cases do not get blocked. These shifts also occur in Tests 9, 10, 11 and 12 but are not as prominent. In the last group of tests there are no significant effects of the side bands. The evolution of the side bands through the domain can be seen in the frequency spectra plots for the monochromatic tests (see Appendix D). The frequency spectra have been plotted on a semilog scale. For each case the frequency spectra have been smoothed via Bartlett averaging, giving 12 degrees of freedom and $\delta f \approx 0.012$ hz.

3.2 Wave reflection tests

Wave reflection from the blocking point occurs only when the incident wave is small enough such that there is no wave breaking at or before the blocking point. Since wave energy cannot propagate beyond the blocking point, and no energy is lost due to wave breaking, the waves get reflected back. The reflected waves are peculiar in the sense that their phase speed is still moving against the current, but their group velocity moves with the current. In other words the wave energy is washed down by the currents. As the waves propagate further away from the blocking region, they continue to get shorter and

shorter. The incident and reflected waves superimpose to form the typical nodes and antinodes patterns in the amplitude envelope.

To study this phenomenon a total of 15 test cases were run. Just like in the wave breaking experiment, the tests were divided into three groups. Each group consisted of 5 test cases having a constant wave period and increasing wave heights. The incident wave heights were gradually increased to study the effects of nonlinearity on the shape of the amplitude envelope. Wave blocking occurred close to the narrowest part of the channel ($x = 0$). To capture the variation in the amplitude shape close to the blocking region, 43 gage measurements were made between $x = -1.5$ m and $x = 0.8$ m. At each gage location the time series have been recorded for 256 wave periods. Similar to the breaking wave tests a detailed data set was obtained by moving the gages to different locations and repeating the experiments. This was done 6 times. The initial conditions were obtained from a fixed gage kept at $x = -4.6$ m, and is tabulated in Table 2. The repeatability tests (Figure 15) show that the experiments are repeatable to within 4% error.

Wave height and period distributions for all the 15 test cases are shown in Figures 18 and 19. Scatter in the wave period distribution, at low wave amplitudes occurs due to the noise in the system. Apart from this scatter, the wave period remains constant for all the test cases. This is because the wave heights are too small to develop any side band instabilities. The change in the shape of the amplitude envelope, with increasing wave amplitude, is clearly visible when we move from Test 1 to 5, and then again for Tests 6 to 10 and Tests 11 to 15. In the case of Test 11, according to linear theory, no blocking should occur. But partial wave reflection still occurs because the required blocking current is close to the maximum current (Stiassnie and Dagan, 1979). With increasing amplitude, the required blocking current moves further away from the maximum current, and no wave reflection pattern is observed. The frequency spectra for all the test cases are shown in Appendix E. The frequency spectra have been plotted on a semilog scale. For each case the frequency spectra have been smoothed via Bartlett averaging, giving 12 degrees of freedom and $\delta f \approx 0.012$ Hz.

4 Random wave tests

The motivation for conducting random wave tests was to study the dynamics of the wave field under blocking and current limited breaking conditions. To do this 20 spectral design conditions were used. The aim was to use TMA spectra for all our cases, but this was not possible because, due to the strong current, all the high frequency components were blocked at the paddle itself. The experiments were initially designed such that there were 5 groups of 4 test cases. In each group the peak frequency was kept fixed and the energy of the spectrum varied. But, the spectrum evolves as it moves against the current, and the spectrum measured at the first gage showed that the peak frequency shifted depending upon the wave energy of the spectrum. As a result, the initial spectral quantities for our experiments were determined from the first gage which was fixed at $x = -4.6$ m. The results are shown in Table 3 in terms of the significant wave height (H_s) and significant wave period (T_s), determined with the help of a zero-upcrossing method. The initial test spectra are also shown in Figures 21 and 22.

For each test case, 36 gage measurements were made between $x = -4.6$ m and $x = 4.61$ m. The detailed measurement set was obtained by moving the gages and repeating the experiments 5 times. Figure 20 shows that the experiments were repeatable to within 3% for all the test cases. The record length at each gage was 1000 seconds, and sampling frequency was fixed at 50 hz. The significant wave heights and periods were obtained with the help of the zero-upcrossing method, and are shown in Figures 23 to 26. The tests vary from most of the spectrum getting blocked, to almost no blocking. In all the tests wave breaking was observed. The frequency spectra plots for all the test cases are given in Appendix F. The spectra have been smoothed using a Bartlett averaging technique, giving 24 degrees of freedom and $\delta f = 0.012$.

5 Narrow banded wave spectra

Experiments were also conducted with narrow banded wave spectra. These tests were divided into two parts – Wave groups (obtained from a bichromatic spectrum) and wave packets (obtained from a normally distributed spectrum). The aim was to see the effects of a moving blocking point due to a modulating wave train.

5.1 Wave group tests

Wave groups were constructed by superposing two monochromatic waves having the same amplitude but slightly different frequencies. The difference between the frequencies determining the number of waves in a group. In all 3 different sets of wave groups were used. Each set consisted of 4 different energy levels, making a total of 12 tests. The test particulars are given in Table 4. Similar to the random wave tests, 36 gage measurements were made for each test between $x = -4.6$ m and $x = 4.61$ m, by moving the gages and repeating the experiments 5 times. Figure 27 shows that the experiments were repeatable to within 3% for all the test cases.

The frequency spectra at the first gage ($x = -4.6$ m) for all the test cases are shown in Figure 28. From the figure it is obvious that the initial spectra is not bichromatic. For the larger wave amplitude tests, wave energy is transferred to the side bands. There is also an extra wave component at a frequency slightly greater than 1 hz. The closer the frequency of one of the design wave components to 1 hz, the greater is the energy at this undesired wave component. The cause for this anomalous behavior is currently being studied. The corresponding time series for these tests are shown in Figures 29 and 30. The evolution of the frequency spectra and corresponding time series for all the tests is given in Appendices I and J.

5.2 Wave packet tests

Wave packets have been generated with the help of Gaussian shaped frequency spectra. For our experiments 12 design test conditions were generated. Just like in the case of the wave group tests, these tests have been divided into 3 sets. Each set consisting of 4 different test conditions with

varying energy content. The equation for the design spectra was given by

$$S(f) = \frac{\gamma}{\sqrt{2\pi\alpha}} \exp\left(-0.5 \frac{(f - f_p)^2}{\alpha^2}\right) \quad (3)$$

where, f_p is the peak frequency, and γ and α are coefficients determining the energy content and width of the spectrum. The larger the value of α , the lesser the number of individual wave components in the packet.

The time series of the wave paddle motion for the 12 cases are shown in Figures 31 and 32. Unfortunately, by the time the wave packet reached the first gage ($x = -4.6$ m), the packet had diffused out, leading to much smaller wave heights (see Figures 33 and 34). This is specially true for Test 3, where the signature of the wave packet has been all but lost in the noise of the water surface. The test particulars for the wave packet tests are given in Table 5. H_{max} is the maximum wave height in the wave packet. T_p is the peak period and α is the parameter used in (3). The modulation of the wave packets as they travel through the blocking region, and their corresponding frequency spectra are given in Appendices K and L. The sampling frequency for all the tests is 100 hz.

A Naming convention used for the data files

Both the ADV and the wave gage data have been stored in an ASCII format. The wave gage data is stored as a time series of the water surface in cm. The ADV data is stored as a time series of the velocity in cm/s.

The naming convention for the wave gage data for the different experiments is based on the dates on which the experiments were started and is given by

$$\mathbf{g}[gage\ no]_{-}\mathbf{c}.[date]\mathbf{t}[test\ no]$$

where, $[gage\ no]$ signifies the gage location, $[test\ no]$ the test and $[date]$ the particular set of experiments.

Monochromatic breaking wave tests These experiments are denoted by $date = may15$. There are 18 different tests and each test consists of 29 gage measurements.

Monochromatic wave reflection tests These experiments are denoted by $date = aug30$. There are 15 different tests and each test consists of 43 gage measurements.

Wave group tests These experiments are denoted by $date = sep18$. There are 12 different tests and each test consists of 36 gage measurements.

Wave packet tests These experiments are denoted by $date = sep26$. There are 12 different tests and each test consists of 36 gage measurements.

Random wave tests These experiments are denoted by $date = oct09$. There are 20 different tests and each test consists of 36 gage measurements.

The ADV data measurements were made in the form of vertical profiles of the horizontal current. The naming convention for the ADV data is as follows

$$\mathbf{JUL}[pos\ no]\mathbf{S}[prof\ no].\mathbf{VEL}$$

where $[pos\ no]$ denotes the vertical position of the measurement in a profile, and $[prof\ no]$ denotes the particular profile. There are a total of 26 profile measurements and their particulars are given in Table 6. Each profile consists of 14 vertical measurement locations, and their elevation from the still water surface is given in Table 7.
