Flower Power!

A flower is a special part of the plant. Flowers have petals. Inside the part of the flower that has petals are the parts which make pollen and seeds.
Going underground
Most plants grow in the ground, with **stems** above, and **roots** below.
**Pretty pollinators**

Butterflies (like Monarchs) are attracted to bright, scented flowers. They help move sticky **pollen** from one flower to another flower — a process called **pollination**. This helps create new flowers!
A cactus ... in Delaware?
Yep—the Eastern Prickly Pear cactus is native to Delaware! Topped with purple fruits, it also has prickles and spines to protect it from predators.
