# F. Commodity Recommendations

# **Pesticide Use Disclaimer**

### THE LABEL IS THE LAW

Before using a pesticide, check the labeling <u>distributed with the product at the point of sale</u> for legally enforceable rates and use restrictions and precautions. Although labels are available on the Internet from electronic label services such as CDMS (*http://www.cdms.net/*), Greenbook (*https://www.greenbook.net*), or Agrian (*https://www.agrian.com/labelcenter/results.cfm*) the information contained in these electronic labels may not be identical to the labeling distributed with the product. Please be advised that these electronic label services provide use disclaimers, and in some cases legally binding User Agreements assigning all liability to user of service. (See section D 3.1. Labels and Labeling for more detail.)

#### **Guide to the Recommended Pesticide Tables in the Following Crop Sections:**

- Pesticides are listed by group number or code based on chemical structure and mechanism of action, as classified by the Herbicide Resistance Action Committee (HRAC, https://hracglobal.com/) for herbicides, the Insecticide Resistance Action Committee (IRAC, https://irac-online.org/) for insecticides, and the Fungicide Resistance Action Committee (FRAC, https://www.frac.info/<sup>3</sup>) for fungicides. In this guide, if the group number or code is in bold font, there are resistance concerns for the product.
- 2. Restricted use pesticides are marked with a \* in the Tables. These products may only be used by certified and/or licensed pesticide applicators, and when stated on the label, those making applications under their direct supervision. Some labels may restrict use solely to certified and/or licensed applicators. (See section D 3.2.1 Restricted Use Classification Statement for more detail).
- 3. In addition to the pesticide products listed in the Commodity Recommendations below, other formulations or brands with the same active ingredient(s) may be commercially available. ALWAYS CHECK THE INDIVIDUAL PRODUCT LABELING:
  a) to ensure a pesticide is labeled for the same intended use,
  b) to ensure the pesticide is labeled for the desired crop,
  c) for differences in application rates and % active ingredient(s), and
  d) additional restrictions.
- 4. All pesticide recommendations contained in this document are prescribed for spray applications to a **broadcast area of 1 acre** (43,560 square feet). Adjust the rate accordingly for banded applications (See section E 1.3. Calibrating Granular Applicators) or for chemigation (check labels for amounts per 1,000 feet).
- **5.** Check the label for and do not exceed the maximum amount of pesticide per application and the maximum number of applications per year.
- 6. Bee Toxicity Rating (Bee TR): N=nontoxic; L=minimum impact on bees; M=moderately toxic, can be used if dosage, timing, and method of application are correct, but should NOT be applied directly to the crop if bees are present; H=highly toxic, severe losses expected, -- = data not available.
- 7. In accordance with the USDA National Organic Program, the Organic Materials Research Institute (OMRI) maintains a directory of all products that OMRI has determined are allowed for use in organic production, processing, and handling. These products are catalogued online in the **OMRI Products List** (see *https://www.omri.org/omri-lists*).

# Potatoes

#### **Recommended Varieties**

When selecting varieties, consider market preferences, variety adaptation to local conditions, specific field problems and the susceptibility-tolerance to stress disorders. Use certified, disease-free "seed" (tuber or cut piece used for planting) of good quality from reputable source to maximize yield and quality. Depending on variety, production area and market, crop takes 90 to 160 days to mature and harvest.

| Maturity Group | Varieties <sup>1,2</sup>                                       | Table Stock <sup>3</sup> | Chipping <sup>3</sup> | Yield <sup>3</sup> | Spacing (in.) |
|----------------|--|--------------------------|-----------------------|--------------------|---------------|
| Early          | Andover  | +++                      | +++                   | +                  | 9-10          |

|                | Yukon Gold <sup>5</sup> (yellow flesh)                         | +++                      | No                    | ++                 | 8-10          |
| Late           | Gold Rush  | +++                      | No                    | ++                 | 8-10          |
|                | Katahdin (LR resistant)  | ++                       | No                    | +++                | 8-10          |
|                | Kennebec (VW susceptible, LB tolerant)<br>(not for eastern VA) | ++                       | No                    | +++                | 7-10          |
|                | Lehigh (yellow flesh)  | +++                      | ++                    | +++                | 8-10          |
|                | Marcy  | ++                       | +++                   | +++                | 7-9           |
|                | Snowden (for chips only)                                       | No                       | +++                   | ++                 | 8-10          |

<sup>1</sup>Listed alphabetically within maturity group. <sup>2</sup>LR=Leaf Roll, LB=Leaf Blight, S=Scab, VW=Verticillium Wilt. <sup>3</sup>+=fair, ++= good, +++= excellent. <sup>4</sup>Tubers are extremely susceptible to internal necrosis and hollow heart. <sup>5</sup>Tubers are susceptible to hollow heart during cool growing seasons. Apply one-third of the N at planting and sidedress the remainder when plants are 4-6 inches tall to help reduce hollow heart.

#### **Recommended Nutrients Based on Soil Tests**

In addition to using the table below, check the suggestions on rate, timing, and placement of nutrients in your soil test report and chapter B Soil and Nutrient Management. Your state's soil test report recommendations and/or your farm's nutrient management plan supersede recommendations found below.

|                         |                      | Ŝoi | l Phosp                              | horus Le      | evel         | So               | il Potas                | sium Le       | vel                        |                                      |

|                         |                      | Low | Med                                  | High<br>(Opt) | Very<br>High | Low              | Med                     | High<br>(Opt) | Very<br>High               |                                      |
|                         | N (lb/A)             |     | P <sub>2</sub> O <sub>5</sub> (lb/A) |               |              | K <sub>2</sub> O | K <sub>2</sub> O (lb/A) |               | Nutrient Timing and Method |                                      |
| Potatoes <sup>1,2</sup> | 150-180 <sup>3</sup> | 200 | 150                                  | 100           | $0^{4}$      | 300              | 200                     | 100           | 04                         | Total nutrient recommended           |
|                         | 50                   | 200 | 150                                  | 100           | $0^{4}$      | 300              | 200                     | 100           | 04                         | Broadcast and disk-in                |
|                         | 100                  | 0   | 0                                    | 0             | 0            | 0                | 0                       | 0             | 0                          | Sidedress 4-5 weeks after planting   |
|                         | 0-30 <sup>3</sup>    | 0   | 0                                    | 0             | 0            | 0                | 0                       | 0             | 0                          | Adjust rate based on petiole nitrate |
|                         |                      |     |                                      |               |              |                  |                         |               |                            | testing at flowering                 |

<sup>1</sup>Apply 1 lb/A of boron (B) with broadcast fertilizer; see also Table B-7. in chapter B Soil and Nutrient Management. <sup>2</sup>Apply 20-30 lb/A of sulfur (S) for most soils. <sup>3</sup>For high yielding crop systems (>250 cwt/A), an extra split N application at flowering may be useful. <sup>4</sup> In VA, crop replacement values of 50 lb/A of P<sub>2</sub>O<sub>5</sub> and 50 lb/A of K<sub>2</sub>O are recommended on soils testing Very High.

#### **Plant Tissue Testing**

Plant tissue testing can be a valuable tool to assess crop nutrient status during the growing season to aid with inseason fertility programs or to evaluate potential deficiencies or toxicities. Critical potato tissue test values for most recently matured leaves at first flower are: N 3-4 %, P 0.2-0.5 %, K 3-5 %, Ca 0.6-2 %, Mg 0.25-0.6% and S 0.2-0.5 %. For additional nutrients and other growth stages consult with a tissue testing laboratory or this web link at the University of Florida: *https://edis.ifas.ufl.edu/publication/ep081*.

#### Site Selection, Soil Preparation and Fertilization

The best soils are well-drained, deep, well aerated, sandy, and sandy loam soils high in organic matter (especially muck soils). Avoid heavy soils and soils that adhere to tubers. Ideally, the planting site should have a low to moderate slope to avoid water accumulation near the plants. Use crop rotation to decrease the incidence of soilborne diseases. Avoid fields that have had potatoes in the past 2 years, and those with high nematode populations. Test the soil for nematodes and fertility. Soil compaction reduces the available space for water and oxygen, resulting in a substantial reduction of potato yield. Avoid field operations when the soil is too wet. Vary the depth of tillage from year to year to reduce the chances of developing a hard pan. Incorporate green manure crops and deep-rooted cover crops to help increase soil organic matter, improve soil drainage, and return considerable amounts of crop residue to the soil. Optimum soil pH is 5.5 to 6.5. All P and K can be applied before planting. Split the recommended N (See table: Recommended Nutrients Based on Soil Tests above).

#### **Seed-Piece Treatment**

Use certified seed. See Disease Control below.

#### **Planting and Spacing**

The recommended planting dates are March 10 to April 5 in MD and coastal VA, March 20 to April 15 in DE, March 20 to April 25 in NJ, and March 25 to June 5 in PA. Space seed 7 to 12 inches apart in 34 or 36-inch rows. Use close spacing for large seed pieces and wider spacing for whole (B-size) seed. Use close spacing for potatoes that are to be marketed in 5 and 10-pound consumer packs, and for 'Katahdin' and 'Kennebec', which tend to produce few oversized tubers.

#### Irrigation

Soil moisture and irrigation management are key for the success of the crop (see chapter C Irrigation Management). Shortage of water may reduce tuber size and increase deformation, but water excess may promote late blight and other soil-borne diseases. The critical stage for irrigating potatoes is in early tuber formation and tuber bulking. Potatoes are extremely sensitive to both excessive and deficient water applications. An effective potato irrigation plan requires regular monitoring of the soil water content and an irrigation schedule based on quantitative measurements. Plant available soil water should be maintained above 65% to avoid yield and quality losses. The optimum range for planting is about 70-80%. Soils that are too wet may slow down soil warming and delay sprout development and emergence early in the season. Cool, wet soils can increase seed decay. Available soil water should be allowed to decrease to 60-65% at vine kill. Dry soils during vine kill will increase the chances of developing stem-end discoloration.

#### Harvest and Storage Considerations

Monitor environmental conditions prior to harvest to determine potential incidence of a disorder associated with adverse conditions (see Common Physiological Disorders below). Pre-harvest conditioning in potato is critical to set the skin and facilitate harvest. In early harvests, vine killing can hasten or improve skin set on relatively immature potatoes, thus reducing tuber damage during harvest, grading, packing, and shipping. Tubers stop growing after vine killing and proper skin set improves shelf life, promotes retention of potato quality during transport, and improves eye appeal. Chemical vine killing is the most common method (see Vine Killing below), but mechanical vine killing (mowing) is also used. Vines of potatoes going into storage should be completely dead at least 14-21 days before harvest. Use potato chain diggers or other means of bulk-harvest with appropriate design to reduce bruises. After harvest, healing of cuts and bruises is most rapid at 50-60°F (10-16°C) tuber temperature and 90-95% relative humidity without water condensation. This temperature should be maintained 2-3 weeks at the beginning of the storage period. The temperature should then be lowered to 40°F (4°C) for table stock or seed potatoes.

Potatoes for processing are stored at 45-50°F (7-10°C). If a rot-producing agent such as field frost, late blight, or soft rot is present, the curing period should be eliminated, air flow increased, and the temperature lowered to  $45^{\circ}$ F (7°C) as soon as possible. Monitor the storage daily and, if the rot continues, sell the crop immediately.

| Disorder                      | Primary Cause                 | Occurrence                  | Market Effect                   |
|-------------------------------|-------------------------------|-----------------------------|---------------------------------|
| Blackheart                    | low oxygen, wet soil          | bulking, storage            | quality, poor processing        |
| Brown center and hollow heart | rapid growth after stress     | early to mid-bulking        | quality, poor processing        |
| Chaining                      | hot soil                      | mid-bulking                 | yield (size)                    |
| Chilling, Freezing            | low temperature               | harvest, storage            | quality, yield prone to rots    |
| Deformation                   | growth stops and go           | bulking                     | quality                         |
| Greening                      | Light                         | bulking, storage            | quality                         |
| Growth crack                  | wet/dry soil                  | bulking                     | quality                         |
| Heat necrosis                 | heat, acid soil (low Ca)      | harvest                     | quality, yield, poor processing |
| Heat and hair sprouting       | hot soil                      | late bulking, early storage | quality, yield, poor processing |
| Internal sprouting            | piling, sprout inhibition     | storage                     | quality, poor seed              |
| Jelly End, Glassy End         | fast vine death, low moisture | harvest                     | poor processing                 |

#### **Common Physiological Disorders**

Disorders that are associated with adverse environmental conditions or cultural practices are listed below

#### **Air Pollution**

Symptoms appear as tiny spots of brown tissue on the upper surface of leaves and a bronzing of the lower surfaces. Some varieties (*e.g.*, Snowden) are particularly sensitive.

#### Vine Killing

Vine desiccation facilitates harvesting by reducing potato and weed foliage, and to set the skin when done 2 to 3 weeks before harvest. Decisions as to when to kill the vines are based on market, demand for a given size, and the need for non-skinned tubers

### Weed Control

# THE LABEL IS THE LAW-see the Pesticide Use Disclaimer on the first page of chapter F. Recommended Herbicides

- **1.** Identify the weeds in each field and select recommended herbicides. More information is available in the "Herbicide Effectiveness on Common Weeds in Vegetables" (Table E-3) in chapter E Pest Management.
- 2. Minimize herbicide resistance development. Identify the herbicide mode of action group number and follow recommended good management practices; bolded group numbers in tables below are herbicides at higher risk for selecting resistant weed populations. Include non-chemical weed control whenever possible.

| Group    | Product Name<br>(*=Restricted Use)                   | Product Rate                         | Active Ingredient         | Active Ingredient Rate                           | PHI<br>(d) | REI<br>(h)    |
|----------|--|--------------------------------------|---------------------------|--|------------|---------------|

paraquat. Application of paraquat "under the direct supervision" of a certified applicator is no longer allowed. Required training link (*http://usparaquattraining.com*); certified applicators must repeat training every three years.

#### 2. Soil-Applied (Preemergence/Drag-Off)

| Group | Product Name<br>(*=Restricted Use) | Product Rate    | Active Ingredient | Active Ingredient Rate | PHI<br>(d) | REI<br>(h) |
|-------|------------------------------------|-----------------|-------------------|------------------------|------------|------------|
| 2     | Matrix 25DF or<br>Solida 25DF      | 1.0 to 1.5 oz/A | rimsulfuron       | 0.0156 to 0.023 lb/A   | 60         | 4          |

-Apply immediately after hilling or drag-off.

-Apply with nonionic surfactant at 0.25% v/v (1.0 qt/100 gal of spray solution) if weeds are emerged at time of application.

-Controls many weeds including foxtail species, pigweed species, wild mustard, and wild radish. Suppresses common lambsquarters, common ragweed, jimsonweed, morningglory species, and yellow nutsedge. Tank mix with other residual products to improve spectrum of weed control. Control may be reduced if grasses are large or if hot, dry weather or drought conditions occur.

-Yellow nutsedge, wild onion, or broadleaf weeds will not be controlled.

-Repeated applications may be needed to control certain perennial grasses.

-Temporary chlorosis may occur to potatoes under stress from drought, cold temperatures, high temperatures, or extreme temperature variations.

-Do not tank mix with or apply within 1 week before or after any pesticide unless labeled. The risk of crop injury may be increased, or reduced control of grasses may result. Matrix is an ALS inhibiting herbicide and resistant weed populations are common in the region. Do not use Group 2 herbicides repeatedly in the same field. -Maximum for Matrix: 2.5 oz/A per year.

| Do not us | se oloup 2 heroleides leped | cary in the sume neta. In |               | i per yeur.       |        |
|-----------|-----------------------------|---------------------------|---------------|-------------------|--------|
| 3         | Prowl H2O 3.8CS             | 1.5 to 3.0 pt/A           | pendimethalin | 0.71 to 1.43 lb/A | <br>24 |
|           | Prowl 3.3 EC                | 1.8 to 3.6 pt/A           |               |                   | 1      |

-Apply preemergence after planting, but before potatoes and weeds emerge, or after drag-off.

 -Activity of Prowl H2O is improved by incorporation. Apply preemergence incorporated after planting but before potatoes and weeds emerge. Where drag-off is practiced, apply and incorporate before, at, or after drag-off, but before potatoes and weeds emerge.
 -Ensure incorporation equipment does not damage seed pieces or elongating sprouts.

-Prowl H2O controls certain broadleaf weeds and annual grasses. Does not control yellow nutsedge.

-Use lower rates on coarse-textured soils with < 3% organic matter and higher rates on medium- and fine-textured soil with > 3% organic matter. Tank mix with appropriate postemergence herbicides if weeds are emerged at time of application. Tank mix with other residual herbicides such as Lorox or Metribuzin to improve broadleaf control.

-Application to 'White Rose' variety during or followed by cool and/or wet conditions may result in crop injury.

 -A maximum of 1 application per season is allowed.

 3
 Sonalan HFP 3EC
 1.3 to 2.67
 ethalfluralin
 0.49 to 1.0 lb/A
 - 

#### -Supplemental labeling expires September 1, 2023.

-Apply after planting but before potato emergence.

-Use lower rates on coarse-textured soils and higher rates on medium- and fine-textured soil.

## Above-ground Pests

#### Aphids

Insecticide treatments are recommended when aphid counts exceed 2 per leaf prior to bloom, 4 per leaf during bloom, and 10 per leaf within 2 weeks of vine kill. Apply one of the following formulations:

| Group   | Product Name                  | Product Rate                | Active Ingredient(s)                         | PHI | REI | Bee |

#### Colorado Potato Beetles (CPB) – Pre-plant or Planting Application

**Pesticide Resistance Management** Do not rely exclusively on the neonicotinoid class of insecticides (Class 4: Actara, Assail, Cruiser, Gaucho, imidacloprid, Leverage 360, Platinum, Scorpion, or Venom) for CPB control. It is important to use all available effective pest management strategies, including crop rotation, pest scouting, treatment thresholds, and alternative (different class) insecticides, such as abamectin (Agri-Mek), Blackhawk, Coragen, Entrust, Radiant, Rimon, Verimark, Voliam Xpress, or Vydate.

For rotated fields adjacent to CBP overwintering sites or to previous year's potato fields, most of the colonizing adults can be killed by treating only a strip of rows along the field edge where the invasion front is expected. Fields should still be monitored for beetles and other insect pests throughout the season.

# DO NOT use foliar applications of any neonicotinoid insecticide (clothianidin, imidacloprid, thiamethoxam, dinotefuron, acetamiprid) in fields previously treated with seed-treatment or at-planting neonicotinoids.

| Apply on   | e of the following formulatio   | ns. PRE-PLANT OR PL         | ANTING APPLICATION                           |     |     |     |

#### Colorado Potato Beetles - continued

#### **Colorado Potato Beetles - Postemergence Application**

Rotation to non-solanaceous crops (crops other than potato, tomato, eggplant, and pepper) is extremely important in reducing CPB problems. Avoid applying late-season sprays to prevent the buildup of insecticide-resistant beetles.

Beginning at plant emergence, sample fields weekly for CPB to determine the need to spray. Select at least 10 sites per field along a V- or W-shaped path throughout the field. At each site, select 1 stem from each of 5 adjacent plants and count and record all adults, large larvae (larger than half-grown), and small larvae (smaller than half-grown). If more than 50 adults or 75 large larvae or 200 small larvae are counted per 50 stems, treatment is recommended. Yield loss because of CPB feeding depends on the age of the potato plant. 'Superior' variety (short season) cannot compensate for early season defoliation by overwintered beetles, but during the last 30 days of the season, 'Superior' can withstand up to 50% defoliation without yield loss.

| Note: Several of these insecticides may no longer be effective in certain areas due to CPB resistance. |

#### Cutworms

See also section E 3.1. Soil Pests - Detection and Control.

Present during July and August. Especially troublesome to tubers where soil cracking occurs. Variegated cutworms feed on lower leaves and petioles, and protective sprays should be applied if numbers exceed 6 worms per plant or foliar loss is more than 10%. Black cutworms are largely underground feeders but will occasionally feed on leaves.

#### **European Corn Borers (ECB)**

Proper timing of ECB sprays is critical. Apply first spray when 10% of the stems have entry holes in fresh market varieties or 25% in processing varieties. Make 2 to 3 applications on a 5-10-day schedule. Consult your county Extension agent and/or area pest management newsletter.

#### **Potato Tuberworms**

Treat when foliage injury is first noted; 4 to 5 applications at 7 to 14 day intervals may be needed. Tuberworms are primarily a problem on the fall crop. Because moths are actively flying at dusk, sprays are most effective when applied early evening.

| Apply on | Apply one of the following formulations:  |                           |                                       |            |            |           |  |  |  |

### **Disease Control**

# THE LABEL IS THE LAW-see the Pesticide Use Disclaimer on the first page of chapter F. Recommended Fungicides

### <u>Nematodes</u>

See sections E 1.5. Soil Fumigation and E 1.6. Nematode Control (including "Nonchemical Management of Nematodes" - certain mustard green cover crops planted in the fall and incorporated prior to planting may offer nematode suppression). Use fumigants listed in section E 1.5., or one of the following:

#### **Seed-Piece Treatment**

Use certified seed. Keep seed at 65-70°F (18-21°C) for 2-3 weeks before planting to encourage rapid emergence. Plant seed pieces immediately after cutting or store under conditions suitable for rapid healing of the cut surfaces (60-70°F, 16-21°C plus high humidity). Dust seed pieces with fungicides immediately after cutting. Some fungicide seed-piece treatments are formulated with fir or alder bark. Bark formulations have been effective treatments.

| Apply one of the following formulations:   |   |   |   |   |  |  |  |  |

<sup>1</sup>Seed-piece fungicides that contain Early Blight Disease Control (EBDC) fungicides or cymoxanil also provide protection against seedborne late blight infections.

#### **Bacterial and Fungal Diseases**

#### **Bacterial Soft Rot**

Prevent wounding and make certain tubers are dry before packing. Free chlorine wash maintained at 25 ppm chlorine or use of a fresh chlorine rinse maintained at 50 ppm chlorine may help reduce soft rot.

#### **Common Scab**

Potato scab is caused by a soil-inhabiting fungus (*Streptomyces scabies*). The disease is suppressed in acid soils and the optimum soil pH for growing scab susceptible varieties is about 5.0 to 5.2. Scab resistant varieties may be grown at pH 5.5 to 6.2. If lime is needed, apply after potato harvest and before subsequent crops grown in rotation. Plant scab-free seed potatoes. Use resistant varieties and rotate with small grains, corn, or alfalfa. Avoid rotations using red clover. Maintain adequate soil moisture during and after tuber set. Avoid heavy application of manures.

#### Dickeya dianthicola and Pectobacterium spp.

In 2015, *Dickeya dianthicola* was introduced to the Mid-Atlantic region. *Dickeya* and related *Pectobacterium* species are transmitted via infested seed pieces and is thought to have limited or no survival ability in our soils. Growers should purchase certified seed that has been properly inspected and determined free of these pathogens. Growers are reminded to practice sound sanitation practices when handling seed pieces (particularly those not tested for *Dickeya* or *Pectobacterium*) to prevent contamination of other potato seed lots.

#### **Early Blight**

Begin preventative sprays and continue every 7-10 d according to a disease forecasting system where available. If late blight is a threat, then begin sprays when plants are 8 inches tall.

#### Late Blight

Begin fungicide applications when plants are 6 inches tall and repeat every 7 d or apply fungicides according to a disease forecasting system such as BLITECAST or WISDOM. Monitor for progress of the disease by following local Extension reports or visiting the following website (*http://www.usablight.org/*). When a field contains new late blight infections and harvest is near, vines should be destroyed immediately to help prevent tuber infection.

<sup>1</sup>DO NOT apply more than a combined total of 15.0 lb/A of mancozeb 75DF or Polyram 80DF per crop

#### Leak (Pythium) and Pink Rot (Phytophthora)

Leak usually enters the tubers through bruises occurring in conjunction with the harvesting of immature tubers during hot weather. Pink Rot generally occurs in poorly drained areas. Rotate field out of potatoes for at least 2 yr.

#### Verticillium Wilt

Select fields with a low incidence of wilt. Use resistant varieties where possible. Do not plant tomato, eggplant, or pepper in rotation with potato. The use of Sudangrass in rotation with potato may reduce nematode levels. The use of Mocap will reduce lesion nematode levels in the soil, resulting in less Verticillium Wilt.

#### Viruses

Numerous seed-borne viruses can occur in potato including potato leafroll, potato virus S, potato virus M, and several strains of potato virus Y. There has been an increase in occurrence of the potato virus YN strain in the region. Control these seed borne viruses by obtaining virus-free certified or foundation seed.

# If you are having a medical emergency after using pesticides, call 911 immediately.

If you have any of the following symptoms during or shortly after using pesticides: headache, blurred vision, pinpoint pupils, weakness, nausea, cramps, diarrhea, and discomfort in the chest, call a physician and the National Poison Control Center hotline (1-800-222-1222).

#### Your call will be routed to your State Poison Control Center.

Anyone with a pesticide exposure poisoning emergency can call the toll-free telephone number for help. Personnel at the Center will give you first-aid information and direct you to local treatment centers if necessary.

For immediate medical attention call 911. Prompt action and treatment may save a life.

### In Case of an Accident

- Remove the person from exposure.
- Get away from the treated or contaminated area immediately.
- Remove contaminated clothing.
- Wash with soap and clean water.
- Call a physician and the Poison Control Center (1-800-222-1222) or agency in your state.
- Have the pesticide label with you! Follow the First Aid Precautionary Statements.
- Be prepared to give the EPA registration number to the responding center/agency.
